

## FACIAL REJUVENATION

Facial rejuvenation is a strategy that uses a variety of treatments to combat the forces at work in an aging face.

*BOTOX*® Cosmetic is a simple, non-surgical treatment that can temporarily smooth moderate to severe frown lines between the brows and on the forehead, and 'crow's feet' at the outside corners of the eyes. *BOTOX*® Cosmetic is a purified protein which reduces the activity of the muscles that cause frown lines and wrinkles to form. While results may vary, within days of one ten-minute treatment, there is a noticeable improvement in moderate to severe frown lines and wrinkles. Over three million procedures are performed with FDA-approved *BOTOX*® Cosmetic annually.

You should not undergo *BOTOX*® if you are, or might be, pregnant, and if you are breastfeeding. Advise your physician of your medical history, and if you suffer from any disease that involves your muscles or nerves. Some medical substances may interfere with the *BOTOX*® cosmetic, so let your doctor know the medications that you use. Antibiotics and medicines used to treat heart rhythm disorders interfere with *BOTOX*® and cause more side effects. Side effects, while rare, are possible, and include headache, nausea, and infection.

*RESTYLANE*® offers a complete solution for tissue-tailored facial augmentation - a natural beauty lift, using the body's own material. Many people today are showing increased interest in correcting wrinkles and folds, shaping facial contours, and augmenting the lips. *RESTYLANE*® is a crystal-clear, biodegradable NASHA (Non-Animal Stabilized Hyaluronic Acid) gel, which is injected into the dermis layer of the skin in tiny amounts with a very fine needle. The result is instant and produces a long-lasting, natural enhancement, both gentle and safe for the skin.

Since it was launched in 1996, *RESTYLANE*® has undergone extensive histological and clinical studies with an

increasing body of evidence relating to its ease of use, tolerability and effectiveness. Close to two million such treatments have been successfully performed world-wide.

The *Erbium Laser* is the newest generation of skin resurfacing for cosmetic purposes. Designed to treat superficial to moderately deep lines and wrinkles, mild to moderate acne scarring, and sun-damaged skin, the *Erbium Laser* has significant benefits over previous options for skin resurfacing on the face, neck, back of hands, and chest. A reduction in side effects, a faster healing time, and reduced pain has made the Erbium laser a popular choice among men and women wishing to reverse the effects of aging.

The *Ultralight Q-switched Laser* is designed to treat pigmented lesions, including age spots, vascular lesions, spider veins, and to remove tattoo ink. Using an intense beam of light, the laser heats and vaporizes pigment instantly.

Call today for an appointment to discuss which treatment option is right for you.
